Full-Stack Software Engineer – AI-Powered Products
Bengaluru, India

Summary

• Full-stack software engineer who has shipped production reconciliation and financial-workflow infrastructure at a fintech startup, including an AI-powered feature for querying uploaded financial data, and independently built and shipped a full-stack expense-tracking product. Comfortable owning a feature end-to-end: backend logic, APIs, database design, and frontend.

Experience

•OneCap Technologies Pvt. Ltd. *July 2025 – Present*

Software Development Engineer I Bangalore

– Owned and developed the frontend architecture from the ground up, building and scaling a single application spanning 10-11 distinct products, using Next.js, TypeScript, and React.
– Owned matching logic for bank reconciliation – one-to-one, one-to-many, partial, and credit/debit-note (CN/DN) matching – as part of the team building OneCap's AI-native reconciliation engine, validated on 2,000+ ledger pairs.
– Owned end-to-end a self-serve AI-powered feature letting customers upload CSV, XLS, or PDF statements from any ERP and directly ask questions about their data – no API integration or manual processing required, removing a key onboarding barrier.
– Designed and built balance confirmation workflows end-to-end – request creation, customer responses, notifications, and email communication – used by 13 customers (3-4 users each), with RESTful APIs and PostgreSQL schemas.
– Led the frontend implementation of a zero-downtime authentication migration (teammate owned infra/backend), moving from cookie-based auth to JWT-based auth with no user-visible disruption.
– Built an internal debugging chat tool (Claude's Agent SDK, including the AskUserQuestion tool) that replaced manually downloading and cross-referencing multiple files to investigate reconciliation issues with a single conversational interface; wrote skills to dynamically generate instructions from uploaded files.
– Set up GA4 event tracking across the signup funnel, identifying and removing form fields that were causing drop-off.

•OneCap Technologies Pvt. Ltd. *February 2025 – July 2025*

Software Development Intern Bangalore

– Built responsive UIs in Next.js/React for customer-facing financial workflows and integrated them with backend APIs.
– Built reusable UI components and forms, reducing repeated work across feature teams.
– Partnered with backend engineers to implement business workflows and debug production UI issues.

•Cave Labs, PES University *June 2024 – August 2024*

Developer Intern – Unity and React Fabrik Bangalore

– Built a solar panel digital twin with real-time environmental and energy generation visualization, using Unity and React Fabrik.

Independent Projects

•Costiq – Personal Expense Tracker

SMS-based automatic expense tracking (v1 live, in active development)

– Built for personal use to automate my own expense tracking without manual entry; v1 shipped and in daily use.
– Currently extending the architecture (multi-tenancy, security hardening) to support additional users.

Research

• **IEEE Publication** – *An Efficient Priority-Aware Scheduling Approach for Federated Data Center Scheduling Frameworks.* Designed a priority-aware scheduling strategy balancing short- and long-running jobs in federated data centers, improving resource utilization and latency-sensitive workload performance. (IEEE Xplore)

Technical Skills

Languages: Python, TypeScript, JavaScript, SQL, C++

Frontend: Next.js, React.js, Tailwind CSS

Backend: FastAPI, REST APIs, Workflow Automation

Databases: PostgreSQL, MySQL

Tools: GitHub

AI/Agents: LLM APIs, Prompt Engineering, MCP, Agent SDKs

Education

•PES University *2021 – 2025*

B.Tech, Computer Science and Engineering CGPA: 8.27
